ChatGPT plugins quickstart

Get a todo list ChatGPT plugin up and running in under 5 minutes using Python. This plugin is designed to work in conjunction with the [ChatGPT plugins documentation](#). If you do not already have plugin developer access, please [join the waitlist](#).

Setup locally

To install the required packages for this plugin, run the following command:

```
pip install -r requirements.txt
```

To run the plugin, enter the following command:

```
python main.py
```

Once the local server is running:

1. Navigate to <https://chat.openai.com>.
2. In the Model drop down, select "Plugins" (note, if you don't see it there, you don't have access yet).
3. Select "Plugin store"
4. Select "Develop your own plugin"
5. Enter in `localhost:5003` since this is the URL the server is running on locally, then select "Find manifest file".

The plugin should now be installed and enabled! You can start with a question like "What is on my todo list" and then try adding something to it as well!
